## Calculating 'Sweep': Know how sweep size is important when choosing a fan

The 'sweep' of a fan is determined by taking the distance from the edge of one blade to the centre of the motor and then doubling that number. For example, if the distance between the edge of one blade and the centre of the motor is 24", you would have a 48" (equals to 1200 mm) ( $24" \times 2 = 48"$ ) sweep ceiling fan. The length of the sweep determines the amount of air that a given fan is capable of churning.

You should ideally choose a sweep depending upon the size of your room. A larger room requires a fan with a longer sweep to keep it cool, whereas a smaller room can be effectively cooled with a fan of a shorter sweep.

### Ways to get the most out of your ceiling fan:

- The room should ideally be well-ventilated (there should be an open window or door)
- The gap between the ceiling and the blades should be at least 1 feet
- The fan (blades) should be at a height of 8 feet from the floor

### Calculate the ideal sweep for your room:

- Find out the prospective fans' sweep in millimeters and multiply it by 2
- Now match the figure against the table below to find the perfect fan for your room

Size of the room	Fan sweep in mm
Upto 10'x 10'	900 or 1050
10'x 10'	1200
10'x 10' or 12'x 12'	1400
More than 12'x 12'	2 or more fans recommended
